

• A 4-HOUR HANDS-ON WORKSHOP

Stop Chatting With AI.

Let It Build, Test & Deploy

— A working day with Claude Code —

Claude Code is Anthropic's terminal-based coding agent. This is a hands-on session on how engineers actually drive it.

From Chatting To Building

Most devs are still copy-pasting between a chat tab and an editor.

Claude Code lives inside your terminal — and ships work for you.

THE DIFFERENCE:

Chat-tab AI

"Here's a snippet. Good luck wiring it up."

Agentic CLI

Reads your repo. Edits files. Runs tests. Opens PRs.

Same model. Different surface. Completely different leverage.

CONCEPT PRIMER

The Agentic Coding Loop

Strip away the marketing and Claude Code is six things, in order, on repeat.

- | | | |
|---|---------------|--|
| 1 | Read | Pulls in files, configs, and project memory |
| 2 | Plan | Breaks the task into concrete steps before touching code |
| 3 | Edit | Writes or modifies files with diff-level precision |
| 4 | Run | Executes commands, tests, and scripts in your shell |
| 5 | Verify | Reads output, catches errors, fixes its own work |
| 6 | Ship | Commits, opens PRs, and deploys when you say go |

Master this loop and the rest of the AI tooling stack stops feeling magical.

THE CURRICULUM

Four Modules. One Deployed App.

MODULE 1

Foundations & CLI environment

MODULE 2

Project memory: CLAUDE.md + MCP

MODULE 3

Build a React + Vite app, live

MODULE 4

Deploy, automate, scale to a team

Each module builds directly on the previous one.

Foundations & The CLI

WHAT YOU'LL WALK AWAY WITH:

- ✓ Install Claude Code and configure it for your shell
- ✓ Permissions, allowlists, and sandboxed command execution
- ✓ Interactive CLI workflows — sessions, history, and recovery
- ✓ Author custom slash commands for repeatable tasks
- ✓ Hook into VS Code and JetBrains without leaving the terminal
- ✓ Read a Claude Code session like an engineer, not a user

Project Memory & MCP

MAKE THE AGENT KNOW YOUR CODEBASE:

- ✓ Why CLAUDE.md is the single most important file in your repo
- ✓ Structuring project memory — conventions, gotchas, do-not-touch zones
- ✓ Sub-agent memory and how context flows between tasks
- ✓ Model Context Protocol (MCP): connect Claude to real systems
- ✓ Wire up MCP servers for GitHub, databases, and your own tools
- ✓ When to add to memory vs. pass in a single prompt

Build A Real React + Vite App

LIVE, END-TO-END:

- ✓ Scaffold a React + Vite app from a single prompt
- ✓ Add routing, state, and components in iterative passes
- ✓ Hit a real API — fetch, transform, render, handle errors
- ✓ Drive the dev server and verify changes in a browser
- ✓ Refactor with confidence using diffs and test feedback
- ✓ Treat Claude Code like a pair, not a vending machine

 React

 Vite

 REST APIs

 Browser DevTools

Deploy, Automate, Scale

FROM YOUR LAPTOP TO THE OPEN WEB:

- ✓ Automate the boring stuff: lint, format, test, release notes
- ✓ Wire up GitHub workflows that Claude can trigger and read
- ✓ Deploy to Vercel — preview URLs, env vars, and rollbacks
- ✓ CI/CD patterns that work with an agent in the loop
- ✓ Team conventions: shared CLAUDE.md, code review, guardrails
- ✓ Where Claude Code fits in your day — and where it doesn't

 Vercel

 GitHub Actions

 MCP Servers

 Hooks

What You'll Walk Away With

Ship a working React app, live.

Not a screenshot or a demo gif — a deployed Vercel app you built with Claude Code, end-to-end, during the session.

Read agentic codebases fluently.

You'll recognize the moving parts: project memory, MCP servers, slash commands, sub-agents, hooks, and permission scopes.

Stop fighting your AI tools.

Most of the pain isn't the model — it's how the project is wired. You'll leave with patterns that make Claude Code feel obvious.

Move from prompts to systems.

Prompting is a skill. Configuring an agent to ship reliable work is a different skill. This workshop is about the second one.

BUILT FOR

- Developers wanting to 10× their coding throughput
- Founders & builders shipping MVPs at speed
- Engineers exploring agent-based dev workflows
- PMs, designers, and beginners building software

WANT TO BUILD THIS LIVE?

Join the hands-on CodeShift workshop.

We set up Claude Code, build a React + Vite app, and deploy it to Vercel — together, in one focused session.
